Abstract

The European Social Survey (ESS) is a new multi-country survey covering over 20 nations.
Its twin aims are - firstly - to monitor and interpret changing public attitudes and values within Europe and to investigate how they interact with Europe's changing institutions, and - secondly - to advance and consolidate improved methods of cross-national survey measurement in Europe and beyond.

The project is funded jointly by the European Commission's 5th Framework Programme, the European Science Foundation and academic funding bodies in each participating country, and is designed and carried out to exceptionally high standards. It involves strict random probability sampling, a minimum target response rate of 70% and rigorous translation protocols. The hour-long face-to-face interview includes (amongst others) questions on immigration, citizenship and socio-political issues.

Weighting

DESIGN WEIGHTS

In general design weights were computed for each country as follows.

1.w = 1/(PROB1*...*PROBk) is a nx1 vector of weights ; k depends on the number of stages of the sampling design. Inaccuracies in higher decimal places in the PROB variables were smoothed.

2.The identification numbers "idno" of missing weights is reported for each country.
Each missing in w was replaced by the sum of weights without missings divided by n minus m, where n is the number of cases in the net sample and m denotes the number of missing weights. After an iteration procedure the missings were replaced by ones in the final vector of weights.

3. Extremely large weights were truncated to final weights of value K. In most countries K = 4.
Only in Norway and Portugal we had to increase K to ensure that after rescaling in step 4 all weights do not exceed K. For Norway K = 4.055 and for Portugal K = 4.34.

4. All weights were rescaled in a way that the sum of the final weights equals n. This means w=1/(PROB1*...*PROBk) rescaled weights=n*w/sum(w)

POST-STRATIFICATION WEIGHTS:
The purpose of the post-stratification weights (PSPWGHT) is to reduce sampling error
and non-response bias, using auxiliary information. The ESS post-stratification weights
have been constructed using information about age, gender, education and region.
The ESS post-stratification weights also adjust for unequal selection probabilities
(design weights).
A raking procedure has been used in the production of the post-stratification weights.
Source population figures: Eurostat. The European Union labour force survey (EULFS).
For Israel and Norway: ESS Appendix A1 Population Statistics.

POPULATION WEIGHTS
The Population size weight (PWEIGHT) corrects for population size when combining two or more country's data, and is calculated as PWEIGHT=[Population aged 15 years and over]/[(Net sample in data file)*10 000]
